

**Stop Running in the Dark! Eagle Tree Systems, LLC is pleased to announce powerful eLogger V3!**

**After listening to your valuable feedback**, we're excited to announce our eLogger V3! The V3 is packed with new logging features you've requested, while continuing to maintain full compatibility with all eLogger sensors:

- Voltage logging increased to 70 volts maximum
- Current logging of +/-100 Amp, with optional +/-150 Amp logging.
- Full support for our GPS Expander module, for flight path graphing and Google Earth™ Support.
- Four times the logging capacity of the eLogger V2.
- Connections for 3 simultaneous temperatures.
- Support for two Brushless RPMs for dual motor vehicles.
- Greatly increased resolution/accuracy.
- Support for throttle logging.

And of course, all the great features of the eLogger V2 are maintained in the V3:

- Current is measured with a true Hall Effects Sensor - NOT a power robbing resistance shunt!
- Great for bench monitoring of battery charging also!
- Accepts optional inexpensive sensors for Temperature, RPM (brushless, magnetic or optical), Airspeed, Altitude, Servo Current, Throttle Movement, and more, available below
- All data are logged to permanent memory, which retains the data even when the power is removed
- Software computes Wattage, mAH, etc. for complete e-flight data.
- Fully Compatible with Windows Vista, 98SE, ME, Win2K and XP™
- Integrated USB with included cable (NOT a USB to serial port cable like other loggers)

- Weighs about 0.7 oz (20 grams). Version with Wire Leads weighs slightly more.
- Supports USB Live Mode, which lets you see what's happening in the model LIVE on the bench, on your PC
- Adjustable logging rate (1-10 samples/second) and lossless data compression for long log times
- Comes with our state of the art Windows virtual playback display and graphing
- Powerful Graphing software has advanced charting features, such as amps vs volts
- Internet Updatable firmware - as we add new features or (heaven forbid) have a firmware bug, the update is just a download away! No need to ship hardware back and forth.
- Full support for English and Metric units

And best of all, the price is the same as the V2!

See your favorite Hobby dealer or [click here](#) to pre-order or for more information!

**Remember**, only the **Eagle Tree eLogger + PowerPanel LCD Display** is both a powerful in-flight (or in-car) logger, and the world's smallest and lightest watt meter/bench monitor, all in one! You can see your data real-time on the PowerPanel or a direct USB connection (for bench monitoring/battery charger monitoring), and of course after your flight with logged data. And, no other logger offers anywhere near the range of features or sensors of the eLogger!
